1. INTRODUCTION

The United States Environmental Protection Agency (U.S. EPA) and the Weston Solutions, Inc. (WESTON®), Superfund Technical Assessment and Response Team (START) prepared this technical memorandum for the West Vermont Street Site (**Figure 1**) in Speedway, Marion County, Indiana. This memorandum documents findings and activities conducted by the U.S. EPA and START in November and December 2011 during an analytical and hydrogeological investigation. The purpose of the field investigation was to determine sources of vinyl chloride (VC) in three drinking water wells in a Residential Area. Also, START and U.S. EPA previously conducted a review of the available data and a limited sampling event. The results of this effort identified data gaps between the potentially responsible party (PRP) properties and the Residential Area (WESTON, 2011). The U.S. EPA attempted to fill these data gaps during the analytical and hydrogeological evaluation discussed in this technical memorandum.

The information presented in this technical memorandum is based on investigation activities and data collected and reviewed by START, as directed by the U.S. EPA. This technical memorandum also documents and incorporates specific historical information and analytical data obtained from the sources listed in **Section 7, References**, for the purpose of determining the potential source or sources of contamination in West Vermont Street residential drinking water wells.

The following subsections discuss the Study Area description and technical memorandum organization.

1.1 STUDY AREA DESCRIPTION

The Study Area for this investigation includes a Residential Area, three PRP properties, and the areas in between, including the Michigan Meadows Apartments property (**Figure 2**). The Residential Area is a neighborhood bounded by West Vermont Street on the south, North Holt Road on the east, West Michigan Street on the north, and North Rybolt Avenue on the west. In the Residential Area, up to 25 homes rely on private drinking water wells as their only sources of

water. Sampling has indicated that wells at three homes in this Residential Area have been contaminated with VC.

START prepared a previous technical memorandum in 2011 that concludes that three PRP properties could have potentially contributed to VC contamination noted in the three drinking water wells in the Residential Area (WESTON, 2011). These PRP properties include: Allison Transmission, Genuine Parts Company (Genuine Parts), and Michigan Plaza. Each property has groundwater plumes consisting of chlorinated volatile organic compounds (VOC), including tetrachloroethene (PCE), trichloroethene (TCE), dichloroethene (DCE), and VC, with one exception. PCE has not been detected in wells at Genuine Parts.

Each PRP property is hydrogeologically upgradient of the water supply wells in the Residential Area, and groundwater plumes from releases of contamination on these properties could have resulted in the contaminants detected in the residential water supply wells. Before this analytical and hydrogeological evaluation, there was no comprehensive analysis of the Study Area because investigation activities focused on individual PRP properties. U.S. EPA identified and sought to fill horizontal and vertical data gaps between the three PRP properties and the Residential Area. Therefore, at the direction of the U.S. EPA, START prepared a Work Plan to address these data gaps.

1.2 TECHNICAL MEMORANDUM ORGANIZATION

Besides this Introduction, the technical memorandum consists of the following sections:

- Section 2, History and Background
- Section 3, Geologic and Hydrogeologic Setting
- Section 4, Investigation Activities
- Section 5, Investigation Results
- Section 6, Findings and Conclusions
- Section 7, References

Figures and tables are presented after **Section 7**, followed by appendices and attachments that provide information relevant to this technical memorandum.

2. HISTORY AND BACKGROUND

In 2009, the Marion County Public Health Department (MCPHD) identified a neighborhood where 25 homes not connected to a municipal water system were using private drinking water wells. MCPHD collected water samples from several of the residential drinking water wells to evaluate water quality. Three sample results from residential wells contained VC detections at concentrations exceeding the U.S. EPA Maximum Contaminant Level (MCL) and Superfund Removal Action Level (RAL) of 2 micrograms per liter ($\mu\text{g/L}$). Subsequent sample results for these three residential wells confirmed VC contamination (**Attachment 1**).

In October 2009, the Indiana Department of Environmental Management (IDEM) formally requested assistance from U.S. EPA. In November 2009 and February 2010, the U.S. EPA installed temporary water treatment systems in the three residences. In 2010, the U.S. EPA conducted groundwater gauging to determine groundwater flow direction in the Study Area. The U.S. EPA directed START to collect groundwater samples from six drinking water wells in the Residential Area and four existing monitoring wells in the Study Area. The samples were analyzed for VOCs, ethane, ethene, and volatile fatty acids. Ethene and ethane results were obtained to determine if VC was being reductively dechlorinated. CAP 18 ME[®] (CAP 18 ME), a refined, food-grade vegetable oil, was being injected into groundwater to enhance the biodegradation of volatile contaminants at the Michigan Plaza property (see **Subsection 2.3**). Volatile fatty acids are a breakdown product of CAP 18 ME, and samples were collected to determine if reductive dechlorination associated with the CAP 18 ME injections was occurring. As a result of these activities, the U.S. EPA identified one additional residential drinking water well with a VC concentration above the MCL and RAL (WESTON, 2011). However, during all other times that MCPHD sampled this fourth residential property, VC concentrations were below the MCL and RAL. Therefore, the U.S. EPA did not install a treatment system at this fourth residential property.

Three PRP properties were identified as potential sources of contamination in the Residential Area: Allison Transmission, Genuine Parts (also known as the Former Allison Transmission Plant 10), and Michigan Plaza (**Figure 2**).

Focus of this analytical and hydrogeological evaluation on these three PRP properties is based on releases of contaminants related to the degradation and breakdown products of PCE and TCE. The following subsections summarize the operations and backgrounds of the three PRP properties as it potentially relates to the groundwater contamination identified in the Residential Area.

2.1 ALLISON TRANSMISSION

The Allison Transmission property includes six plants located north to northwest of the Residential Area (**Figure 2**). Historical activities on the Allison Transmission property included aircraft engine testing, machining, parts cleaning, and storage (ARCADIS, U.S., Inc. [ARCADIS], 2009). Currently, operations on the Allison Transmission property include production of automobile transmissions. General Motors Corporation (GM) previously owned the plant, and is leading the environmental investigation and remediation under a Resource Conservation and Recovery Act (RCRA) corrective action agreement with the U.S. EPA.

Operations at the Allison Transmission property resulted in the release of contaminants to the environment, including, but not limited to, polychlorinated biphenyls (PCB); transmission fluid; and VOCs, including PCE, TCE, DCE, and VC (ARCADIS, 2009). During a RCRA Facility Investigation (RFI), chlorinated solvents were documented to have impacted groundwater at multiple Areas of Interest (AOI). A drawing prepared by ARCADIS identifying these AOIs is included in **Appendix A**. GM developed and implemented multiple remediation systems at many of these AOIs. This memorandum discusses only the AOIs (AOI-40, AOI-42, and AOI-51) that could have an impact on the Residential Area. AOI-40 is the location of a groundwater pump and treatment system which could impact groundwater flow direction, and AOI-42 and AOI-51 are areas where chlorinated solvent contamination has been detected in groundwater near the Residential Area.

AOI-40 is the location of a historical diesel fuel spill. AOI-40 is directly west and hydrogeologically side-gradient of the Residential Area. In 1973, GM installed a diesel fuel recovery system to collect contaminated groundwater at AOI-40. Since 2001, the recovery system has pumped over 16.8 million gallons of groundwater. The system treats approximately 6,900 gallons of petroleum-contaminated groundwater per day. The ongoing operation of this groundwater recovery system helps to maintain a south to southwest flow gradient at the Allison Transmission property (ARCADIS, 2010). In March 2010, groundwater and soil samples collected between AOI-40 and the Residential Area yielded non-detect results for VOCs (ARCADIS, 2011).

At AOI-42, PCE has been detected in groundwater samples. AOI-42 is located on the Allison Transmission property but upgradient from another AOI containing chlorinated solvents (AOI-51) and from the Residential Area. Chlorinated solvents including, DCE, PCE, and TCE, have been detected in groundwater samples from monitoring wells located south of AOI-42 including MW-0636-S2B and MW-0636-S2A (Favero Geosciences [Favero], 2012). Results for monitoring wells further south of MW-0636-S2B and MW-0636-S2A were non-detect for PCE, TCE, DCE, and VC in the September 2011 sampling results. A soil vapor extraction (SVE) system currently is being designed by ARCADIS to address the contamination in this area.

AOI-51 is the closest chlorinated solvent source at Allison Transmission to the Residential Area. Samples collected from this area and have the highest chlorinated solvent concentrations at the Allison Transmission property. GM implemented several remedial efforts at AOI-51. An SVE system was installed at AOI-51 to remove PCE and has been operational since October 30, 2003. A dense nonaqueous-phase liquid (DNAPL) recovery system was installed at the same time as the SVE system. However, DNAPL was not recovered using the system. Therefore, the operation of the DNAPL recovery system was discontinued in 2005. A groundwater recovery and treatment system was installed in 2007 to supplement SVE system and the recovery of PCE (ARCADIS, 2009; ARCADIS, 2011).

GM installed monitoring wells downgradient of AOI-51 along West Michigan Street to monitor contaminant migration from Allison Transmission. Soil and groundwater samples from these

wells showed no contamination migrating from the Allison Transmission property toward the Residential Area (ARCADIS, 2011). However, the U.S. EPA identified horizontal and vertical gaps in this data. For example, monitoring well MW-1103-S3/S4 is located on West Michigan Street north to northwest of the Residential Area (**Appendix A**). This well is screened just above bedrock (85 to 95 feet below ground surface [bgs]). MW-1101-S4, also installed along West Michigan Street, is screened between 92 and 97 feet bgs. Both monitoring wells are screened in zones deeper than AOI-51 contamination and deeper than the residential wells. Therefore, these two wells are not effective for monitoring contaminant migration from AOI-51 and represented a data gap that the U.S. EPA sought to fill during the analytical and hydrogeological evaluation.

2.2 GENUINE PARTS

The Genuine Parts property contains a single warehouse building northeast of the Residential Area (**Figure 2**). Historically, this property was the former Allison Transmission Plant 10 (Fluor Daniel GTI, 1997). Between 1956 and 1973, BHT Corporation operated the plant for carburetor and brake remanufacturing. GM purchased the property from BHT Corporation in 1973 and used the plant for warehousing obsolete machines, tooling, and fixtures until the mid-1980s. BHT Corporation became part of Genuine Parts through acquisition and merger (Keramida Environmental Inc. [Keramida], 2007). Currently, Genuine Parts is conducting environmental work on their property under a Voluntary Remediation Agreement with IDEM.

Two primary source areas of contamination were identified on the Genuine Parts property and are referred to as the eastern source area and western source area. The eastern source area is thought to result from solvent operations conducted near the southeastern corner of the building. A former solvent storage tank was located sub-grade in this area in a concrete structure. The solvent tank was removed in the 1990s. The western source area is associated with former parts degreasing activities and buried drums. Historically parts were placed outside to dry after degreasing. This approach also may have resulted in the release of chlorinated solvent to the subsurface as well (Keramida, 2004, page 3). Additionally, evidence of waste burial and dumping was documented during installation of a remediation system. The buried waste appears to be the primary source of chlorinated solvents in soil and groundwater (Keramida, 2000).

Environmental investigations at the Genuine Parts property identified contaminants in soil and groundwater, including TCE, DCE, and VC; polynuclear aromatic hydrocarbons (PAH); and metals such as cadmium, chromium, and lead. Concentrations have been documented as high as 1,500 µg/L for VC in monitoring well MW-165D in January 2002 (ENVIRON International Corporation [ENVIRON], 2012).

Previous investigations have shown that contamination from the Genuine Parts property has migrated beyond the Genuine Parts property and Little Eagle Creek to the south, southwest, and southeast. Groundwater results from January 2002 indicate that a VC plume extended from the Genuine Parts property south to monitoring well MW-170D (ENVIRON, 2012). VC concentrations ranged from 1,500 µg/L near the Genuine Parts property to 80 µg/L in MW-170D to the south-southwest. This well is located about 200 feet northeast of contaminated residential wells and indicates the presence of VC in the vicinity of the Residential Area as early as 2002. However, there are no groundwater data from MW-170D between 2002 and 2007.

In 2001, a combined remedial system was installed at the Genuine Parts property consisting of air sparging (AS), SVE, and phytoremediation. The AS/SVE system consisted of 44 AS points and 35 SVE wells. The phytoremediation system consisted of the planting and maintenance of poplar trees. In 2004, enhanced reductive dechlorination (ERD) was implemented at the property to enhance natural attenuation occurring in the eastern site area. ERD implementation consisted of corn syrup injections into two wells near a residential neighborhood immediately east of their property. ERD was moderately effective, but had a limited radius of influence (Keramida, 2005). Four full-scale bioremediation injections have been implemented; July 2004, October 2004, October 2006, and December 2007 (Keramida, 2010).

In 2007, remedial activities including soil excavation were conducted to physically remove and isolate source area material. Results for soil and groundwater samples collected after the 2007 remedial activities showed greatly reduced concentrations of contaminants in soil and groundwater (Keramida, 2007). The AS/SVE system continued to operate after the excavation activities (Keramida, 2010).

Between 2002 and 2007, no groundwater data were collected south-southwest of the Genuine Parts property, near the Residential Area. This lack of data represents a significant temporal data gap.

2.3 MICHIGAN PLAZA

Michigan Plaza is a strip mall located east of the Residential Area (**Figure 2**). Historically, Michigan Plaza contained several small businesses including a dry-cleaning company (Mundell & Associates [Mundell], 2005). City directory searches indicate that Accent Cleaners operated at Michigan Plaza from approximately 1971 to 1988 (Mundell, 2003). Currently, a daycare facility, convenience store, and other small businesses operate out of Michigan Plaza. PRPs for Michigan Plaza are conducting environmental investigation and remediation under a Voluntary Remediation Agreement with IDEM.

Soil and groundwater contamination are present below Michigan Plaza (Mundell, 2005; 2007; 2008; 2010a, b, and c; and 2011). Groundwater sampling results indicate concentrations of PCE, TCE, DCE, and VC exceeding groundwater screening criterion. Soil and groundwater contamination at Michigan Plaza resulted from releases of PCE from the former dry-cleaning operations and the breakdown of PCE.

The sanitary sewer is a known contaminant migration pathway at Michigan Plaza. The sanitary sewer system is old and concentrations of contaminants exceeding comparison criterion were noted in soils and groundwater near line connections and at joints or elbows where the piping turns 90 degrees. Several reports document that PCE released into the sewer system has migrated along the sewer line toward the north onto the Michigan Meadows Apartments property (Mundell, 2005; 2007; 2008; 2010a, b, and c; and 2011). This release mechanism created an irregularly distributed contaminant groundwater plume with multiple disconnected source areas designated as Areas A, B, and C, and resulted in co-mingling with the groundwater plume from the Genuine Parts property. Area A is south of the Michigan Plaza building, Area B is northeast of the Michigan Plaza building, and Area C is on the southeast portion of the Michigan Meadows Apartments property.

Remediation at Michigan Plaza has consisted of injections of CAP 18 ME into groundwater to enhance the biodegradation of volatile contaminants. Two such injections have occurred, one in August 2007 and the other in February 2009 (Mundell, 2007; 2008; 2010 a, b, and c; and 2011). In 2007, approximately 47,000 total pounds of CAP 18 ME were injected into Areas A (14,200 pounds), B (20,300 pounds), and C (12,500 pounds) (Mundell, 2008). In 2009, approximately 16,500 pounds of CAP 18 ME were injected: 3,000; 4,500; and 9,000 pounds in Areas A, B, and C, respectively (Mundell, 2009).

CAP 18 ME is a proprietary product of the Carus Corporation manufactured for environmental applications such as anaerobic bioremediation remediation of soils and associated groundwater. CAP 18 ME can be used to degrade chlorinated solvents, nitrates, sulfates, perchlorate, explosives, and other compounds in groundwater. CAP 18 ME provides a carbon source that results in a long-term release of fatty acids, creating conditions favorable for bioremediation (<http://www.caruscorporation.com/content.cfm/cap18>).

According to information on the Carus Corporation website, CAP 18 ME combines non-emulsified vegetable oil with methyl esters specifically manufactured for environmental applications such as the remediation of groundwater through reductive chlorination. According to the Material Safety Data Sheet for CAP 18 ME, the product is composed of soy bean oils, triacylglycerides, and methyl esters (Carus Corporation, 2008). The addition of 10 percent by weight of methyl esters decreases the time for the oils to begin producing fatty acids for reductive dechlorination to reach ideal levels. CAP 18 ME has a lifespan of 3 to 5 years in the aquifer, and some studies indicate that fatty acids may persist in the aquifer for more than 5 years (<http://www.caruscorporation.com/content.cfm/cap18>). The specific gravity of CAP 18 ME is 0.931 gram per milliliter by weight at 50 degrees Fahrenheit; this specific gravity is less than that of water indicating that CAP 18 ME will float on water, and can become a light non-aqueous phase liquid (LNAPL) if high enough concentrations are present in the aquifer.

CAP 18 ME was injected into the groundwater using a Geoprobe grout system under pressure. According to Newell et al, injections of an oil, such as CAP 18 ME, as an LNAPL “may

hydrostatically depress the capillary fringe and water table.” Therefore, the injection of CAP 18 ME into the aquifer under pressure would displace groundwater (Newell et al, 1995, page 5).

Newell et al also indicates that the “hydraulic conductivity of the medium is proportional to the density and inversely proportional to the viscosity of the LNAPL.” The viscosity of soy bean oils ranges from 80 to 800 centipoise (cP) for treated soy bean oils; water has a viscosity of 1.002 cP. Therefore, injection of a high-viscosity fluid, such as CAP 18 ME, would decrease the hydraulic conductivity of the aquifer, also resulting in a decrease in groundwater flow velocity. These conditions generally result in increased hydraulic head and cause a change in the groundwater flow direction because groundwater and associated contamination typically follows the path of least resistance (Newell et al, 1995, page 5).

CAP 18 ME injections have contributed significantly to increased VC concentrations in groundwater at Michigan Plaza. Before the CAP 18 ME injections, VC in monitoring well MMW-P-06 was detected at a maximum concentration of 21 µg/L in November 2005. After CAP 18 ME injections, VC concentrations increased in monitoring well MMW-P-06 to a maximum concentration of 15,600 µg/L in July 2011. VC concentrations in monitoring well MW-170D near the Residential Area increased approximately 10 to 17 months after each CAP 18 ME injection. VC concentrations increased in MW-170D from 105 µg/L in February 2007 to 230 µg/L in June 2008, approximately 10 months after the first CAP 18 ME injection. VC increased in MW-170D again in July 2010 to 233 µg/L, approximately 17 months after the second CAP 18 ME injection (**Figure 3**) (Mundell, 2012).

CAP 18 ME remediation at Michigan Plaza began before the full horizontal and vertical extent of contamination was delineated. There were few monitoring wells at Michigan Plaza in 2007 and only two or three rounds of analytical data collected before the initiation of the CAP 18 ME injections. Additionally, many monitoring wells at Michigan Plaza were blind drilled below the water table (IDEM, 2011). Blind drilling is a process where the wells are drilled without collecting or logging geologic information. Both of the conditions identified above resulted in data gaps that prevent a full understanding of the geology, source migration, and delineation of the initial extent of contamination at Michigan Plaza before the CAP 18 ME injections.

3. GEOLOGIC AND HYDROGEOLOGIC SETTING

This section discusses the geologic and hydrogeologic setting in the Study Area. U.S. EPA and START reviewed the historical documents listed in the References section of this technical memorandum (**Section 7**) and reviewed information obtained during the November and December 2011 investigation activities to develop the discussion below.

3.1 REGIONAL GEOLOGY AND HYDROGEOLOGY

The Study Area lies within the Tipton Till Plain unit. The unconsolidated glacial drift of Speedway, Indiana, is characterized by glacial moraines, till and outwash plains, and outwash channels formed during glacial processes. The Study Area's general topography is consistent with Wisconsin-aged glacial stage advance and retreat. The glacial depositional sequences are composed of varying thicknesses of outwash, including multiple sand and gravel units interbedded with clay till. In the Study Area, sand and gravel typically are unconfined in the upper sequence and semi-confined to confined by clay and silt till at depth. Locally, the glacial drift is underlain by the New Albany Shale of the Devonian System. Regionally, the New Albany Shale is present at approximately 110 feet bgs and extends to approximately 190 feet bgs (Harrison, 1963). The major drainages in Marion County consist of the White River and its two major tributaries - Eagle Creek and Fall Creek. Herring (1976) states, "In the White River Valley the principal Pleistocene aquifer is composed primarily of outwash and valley-train sand and gravel deposits which average 80 to 100 feet in thickness. Except for occasional till lenses, the aquifer extends from the water table down to bedrock" (Herring, 1976, page 18).

3.2 STUDY AREA GEOLOGY AND HYDROGEOLOGY

Little Eagle Creek in the north and eastern portions of the Study Area flows southeast. Big Eagle Creek flows to the south-southeast along the southwestern and southern portion of the Study Area. The two streams converge about 2,000 feet southeast of the Study Area. Both of these surface water features have significant impacts on the hydrogeology of the Study Area. The Study Area is in the A2 hydrogeologic setting, which has been well-studied and is described in the Hydrogeologic Framework of Marion County (Brown and Fleming, 2000). The A2 unit is

composed of “variable thickness of outwash overlying complexly interbedded sand and gravel and till. Thick unbroken sections of sand and gravel are present locally. Sand and gravel units at depth are typically confined or semi confined by bodies of till, whereas the upper portions of the system are commonly unconfined” (Brown and Fleming, 2000).

The north and western portions of the Study Area contain several saturated zones separated by relatively thick and contiguous low-permeability silts and clays, with occasional perched and semi-confined zones (ARCADIS, 2010). As indicated by boring logs, the southern and eastern portions of the Study Area consist of thinner and less continuous low-permeability silts and clays in the upper 30 to 40 feet of the A2 unit. This trend is most evident in the vicinity of the Michigan Plaza where very thin low-permeability silts and clays are present until a low-permeability till unit is observed at approximately 40 feet bgs.

Reports indicate that in the Study Area, Little Eagle Creek is a losing stream and Big Eagle Creek is a gaining stream (ARCADIS, 2005). This contributes to the predominant south-southwest groundwater flow direction.

START generated geologic cross sections for the Study Area. The cross sections are based on geologic data collected by U.S. EPA, START, and the PRPs’ consultants. However, it is important to note that many of the wells drilled by Michigan Plaza’s consultant were blind-drilled (IDEM, 2011). Monitoring wells without basic geologic information are not useful for characterization. Therefore, geology depicted on the cross sections is inferred and may not be accurate around Michigan Plaza and parts of the Michigan Meadows Apartments property.

Figure 4 shows the cross-section transect locations, and **Figures 5 through 7** show cross-sections A-A’, B-B’, C-C’, respectively. The residential well logs were not used to generate the geology on the cross sections, but approximate locations are shown on the cross-sections for perspective. The cross sections are generalized in an effort to show potential pathways between more permeable units. In addition, the A-A’ cross section was constructed to evaluate potential pathways from Michigan Plaza to the Residential Area because elevated VC concentrations were detected at Michigan Plaza.

Monitoring wells in the Study Area screened within the top 10 to 20 feet of the A2 aquifer are usually identified with an “S” to indicate that they are shallow monitoring wells. Monitoring wells that are screened deeper in the A2 aquifer are typically identified with a “D,” “S2” or “S3” designation. Genuine Parts installed both shallow and deep monitoring wells. However, they did not differentiate between shallow and deeper monitoring wells on the Genuine Parts property.

The residential wells are installed within and at various depths in the A2 aquifer, depending on the depth of the permeable saturated unit encountered. The residential wells typically are screened between 35 feet bgs to 75 feet bgs. Of the residential wells with VC detections exceeding the RAL, one is screened at 35 feet bgs (4042 W. Vermont St.), one is screened at 59 feet bgs (4012 Cossell Rd.) and one is screened at 75 feet bgs (4018 W. Vermont St.).

4. INVESTIGATION ACTIVITIES

Several data gaps were identified by the U.S. EPA, including lack of information and lack of continuity of information between data from the PRP properties and the Residential Area. The focus of the analytical and hydrogeological evaluation investigation activities was to obtain additional information to provide a link between the PRPs data and the Residential Area, and to summarize the findings. This section discusses the analytical and hydrogeological evaluation investigation activities, including the subsurface investigation, groundwater gauging, and sampling conducted during November and December 2011.

4.1 SUBSURFACE INVESTIGATION

The U.S. EPA and START conducted subsurface drilling from November 9 through 18, 2011. The investigation included advancing six direct-push technology (DPT) borings along the north side of West Michigan Street, east of North Holt Road, and in the Residential Area. DPT borings SB-01, SB-02, SB-03, SB-05, and SB-06 were advanced along West Michigan Street, and SB-04 was advanced in the Residential Area to evaluate potential VOC contamination in soil and groundwater associated with the release of solvents from former dry-cleaning operations (**Figure 8**). START also drilled four vertical aquifer sampling (VAS) locations between the PRP properties and the Residential Area, and one VAS location on the southern part of the Residential Area. The boring logs are included in **Attachments 2 and 3**. A discussion of Study Area geology is presented in **Subsection 3.2**.

The DPT soil borings were advanced to a maximum depth of 15 feet bgs or to groundwater, whichever occurred first. However, refusal generally occurred before the planned depth was reached. Groundwater was encountered in SB-05 only. Nine surface soil samples and one groundwater sample were collected from the six DPT borings. Soil analytical results are discussed in **Subsection 5.2.1**.

At the five VAS locations, VAS-01 through VAS-05, 14 groundwater samples were collected from soil borings installed along the north, northeast, east and southeast corners of the Residential Area (**Figure 8**). The U.S. EPA and START used a RotoSonic drilling rig, which

uses multiple diameter drilling rods (initially a larger-diameter drilling rod followed by a smaller-diameter drilling rod) in sequence to allow isolation of various water-bearing zones and to prevent cross-contamination between zones. The RotoSonic rig collects continuous lithology samples of a higher quality than those collected using other drilling methods, allowing the identification of thin conductive or confining seams.

A temporary well was constructed at each VAS sampling depth interval determined according to the geology observed during RotoSonic drilling activities. Intervals sampled corresponded to the more permeable formations. Each temporary well screen was advanced down the boring and the drilling rods were extracted slightly above the well screen to allow communication with the aquifer. At each sampled interval, the volume of drilling water inserted into the formation during drilling was purged from the well, and allowed to stabilize. Formation water quality parameters from the different zones were closely monitored during purging prior to sampling using methods similar to those in typical low-flow sampling guidance (Puls and Barcelona, 1996). Accelerated (24-hour) turnaround time was requested for VAS samples to quickly identify the locations and depths for the installation of new permanent monitoring wells.

The DPT and VAS soil and groundwater samples were analyzed by Pace Laboratories in Indianapolis, Indiana, for Target Compound List (TCL) VOCs using U.S. EPA Method 8260. **Tables 1 and 2** summarize the DPT soil and groundwater and VAS groundwater analytical results, respectively. **Subsection 5.2** discusses the results.

Based on the November 2011 VAS temporary well sampling results, permanent monitoring well nests were installed at each of the five VAS locations. Well nests of two permanent monitoring wells were installed at two of the five VAS locations, and well nests of three permanent wells were installed at the remaining three VAS locations for a total of 13 new permanent wells. Monitoring wells MW-WES01a, MW-WES01b, and MW-WES01c were installed at VAS-01; monitoring wells MW-WES02a, MW-WES02b, MW-WES02c were installed at VAS-02; monitoring wells MW-WES03a and MW-WES03b were installed at VAS-03; monitoring wells MW-WES04a and MW-WES04b were installed at VAS-04; and monitoring wells MW-WES05a, MW-WES05b, and MW-WES05c were installed at VAS-05.

The wells were screened either in zones with known VC contamination or in clean permeable zones to monitor for future potential contamination. The new monitoring wells were constructed with 2-inch-diameter, 5-foot-long, 0.010-slot, stainless-steel screens; 2-inch-diameter, stainless-steel risers; and flush-mounted covers. The permanent monitoring wells at each of the five VAS locations were spaced approximately 5 feet apart, with the deepest well in a downgradient or side-gradient location from the shallower wells. This positioning of the wells ensured that groundwater flow and chemistry in the shallower wells would not be influenced by the deeper wells or by well construction materials.

4.2 GROUNDWATER GAUGING AND SAMPLING

After installation of the 13 new monitoring wells in November 2011, the wells were surveyed using a benchmark established during a previous survey. On December 6 and 7, 2011, 152 monitoring wells were gauged and 66 monitoring wells were sampled. Gauging was completed before groundwater sampling. **Table 3** presents gauging results. **Figure 9** shows the monitoring wells gauged.

START selected monitoring wells for sampling based on the historical occurrence of contamination. The groundwater samples were analyzed by Pace Laboratories in Indianapolis, Indiana, for TCL VOCs using U.S. EPA Method 8260. **Figure 10** presents the monitoring wells sampled. **Table 4** summarizes detected constituents and **Subsection 5.2.2** discusses the groundwater analytical results.

The monitoring wells were sampled using standard low-flow sampling protocol with a peristaltic pump when possible or dedicated pumps when present in existing monitoring wells. Typical low-flow sampling protocol involves placing the pump intake near the middle of the screened interval and purging at a rate of 0.5 liter per minute or less (Puls and Barcelona, 1996). During purging, groundwater parameters were monitored, including dissolved oxygen, conductivity, pH, temperature, and turbidity. These parameters were monitored until they stabilized to within plus or minus 10 percent. Groundwater samples were collected in laboratory-provided containers and placed on ice for preservation. Standard chain-of-custody procedures were followed for all samples.

5. INVESTIGATION RESULTS

This section discusses investigation results, including the groundwater flow evaluation and analytical results. The information in this section was derived from (1) historical documents from IDEM, U.S. EPA, and the PRPs' consultants; (2) the March 2011 START technical memorandum (WESTON, 2011); and (3) data collected for this analytical and hydrogeological evaluation in December 2011. Data from historical documents and reports was uploaded into a database. This database is the source of all data discussed below and included on the figures for this technical memorandum. Information in the database includes data from the following sources: Mundell, 2007; Mundell, 2010a, b, and c; ARCADIS, 2012; ENVIRON, 2012; Favero, 2012; Keramida, 2010; WESTON, 2011; and the analytical data collected for this evaluation in December 2011. The data sources are referenced below and shown on the figures for clarity.

The purpose of the investigation was to determine the potential source or sources of VC contamination in residential drinking water wells. VC is created through reductive dechlorination of a parent product through biotic or abiotic means. The basic process is the removal of one or more chlorine groups so that PCE degrades to TCE, then to DCE, and then to VC. VC can then further break down to ethenes, ethanes, or carbon dioxide and water. In some cases, the process can stall at DCE or VC, creating an abundance of DCE or VC in the groundwater, a process called "DCE/VC Stall" (Solutions-IES, 2006). VC is very volatile. However, it is stable in an anaerobic environment such as that found in an aquifer. It is also very mobile in soil and mobile in groundwater (Sims et al 1991).

5.1 GROUNDWATER FLOW EVALUATION

START collected groundwater elevation data during December 2011 to generate potentiometric surface maps. **Table 3** summarizes the December 2011 groundwater elevation data. **Figures 11** and **12** are potentiometric surface maps for the December 2011 groundwater gauging event for the shallow and deep monitoring wells, respectively, in the A2 aquifer.

Figure 11 is based on water level data from wells screened near the top of the water table or potentiometric surface to a depth of approximately 10 feet below the water table. Shallow groundwater in the Study Area predominantly flows south-southwest. Water table flow appears to be influenced by surface water features with some deflection around groundwater recovery systems at Allison Transmission.

Figure 12 is based on water level data collected from wells screened deeper in the aquifer. These deeper wells are screened greater to or equal to 10 feet below the water table or potentiometric surface. **Figure 12** indicates that groundwater in the aquifer also flows south-southwest.

Comprehensive maps of the Study Area had not been previously created because the Study Area is composed of several distinct PRP properties. Historical potentiometric surface maps prepared by individual PRPs typically were created for specific wells and do not include newer monitoring wells installed or monitoring wells nearby that were installed by other PRPs. However, the historical maps prepared generally are consistent with the general trends shown in **Figures 11** and **12**. These figures are the most comprehensive maps available, and data from the 152 gauged monitoring wells were used to create the potentiometric maps.

5.2 ANALYTICAL RESULTS

The subsections below discuss the soil and groundwater sample analytical results.

5.2.1 Soil Analytical Results

The U.S. EPA and START collected 12 soil samples from the six DPT borings in November 2011. **Table 1** summarizes all detected soil sample results from this sampling event. Sample results were non-detect except for samples collected from SB-05. SB-05 was advanced along the sewer line north of the Michigan Plaza property (**Figure 8**). PCE was detected in soil samples collected from 14 to 15 feet bgs and 17 to 18 feet bgs at concentrations of 148 and 9,190 micrograms per kilogram ($\mu\text{g}/\text{kg}$), respectively.

5.2.2 Groundwater Analytical Results

One groundwater sample was collected from SB-05 along the sewer line north of Michigan Plaza and West Michigan Street in November 2011. This boring was the only DPT boring that contained sufficient groundwater for sample collection. PCE concentrations in this sample exceeded the groundwater screening criterion (5 µg/L) in both the sample and the duplicate at 9.7 and 7.5 µg/L, respectively.

In December 2011, the U.S. EPA and START collected groundwater samples from the 66 monitoring wells shown on **Figure 10**. START also reviewed data collected by GM's consultant at Allison Transmission from the fourth quarter of 2011.

START selected monitoring wells for sampling based on the historical occurrence of contamination. The samples were analyzed for TCL VOCs. **Table 4** summarizes the analytical results of detected chemical constituents for the groundwater samples. The cross sections in **Figures 5 and 6** depict the PCE, TCE, and VC analytical results for December 2011, and the VC isoconcentration contours. **Appendix B** provides the U.S. EPA analytical data packages for the groundwater samples collected in December 2011, including the data validation and analytical reports.

It is important to note that Residential Area wells were not sampled before 2009. Therefore, data are not available to determine when VC contamination first impacted the Residential Area drinking water wells. To understand how VC has contaminated Residential Area wells, both current and historical analytical results must be evaluated. The following subsections discuss results for both the fourth quarter of 2011 and for selected historical sampling events.

START produced maps showing PCE, TCE, DCE, and VC analytical results from December 2011 and historical analytical results (**Figures 13 through 33**). When possible, START produced isoconcentration maps. However, isoconcentration maps were not generated for some contaminants because of the lack of detections.

5.2.2.1 PCE Analytical Results

Figures 13 through 17 present PCE concentrations and isoconcentration contours for the Study Area, including figures for the 2011 analytical data and figures showing results from 2005 and 2007. The 2005 and 2007 data were collected before CAP 18 ME injections at Michigan Plaza. These injections changed the nature and extent of contamination in the eastern part of the Study Area. PCE was not detected in any wells at or near Genuine Parts or in the Residential Area wells during the December 2011 sampling. Historically, PCE has not been detected in any wells at Genuine Parts. Therefore, figures were not prepared for Genuine Parts.

Figure 13 shows results for the second quarter of 2005 for AOI-51 at the Allison Transmission property (Favero, 2012; ARCADIS, 2012). Not enough wells were sampled during 2007 to allow comparison to the 2007 Michigan Plaza data set. PCE was detected at a maximum concentration of 30,000 $\mu\text{g/L}$ in MW-0403-S2B. The PCE plume extent is well defined to the south, east, and west on the Allison Transmission property.

Figure 14 presents the PCE isoconcentration contour map for the first quarter of 2007 at Michigan Plaza, the Michigan Meadows Apartments property, and Genuine Parts (Keramida, 2010; Mundell, 2007). PCE concentrations were as high as 6,280 and 3,060 $\mu\text{g/L}$ in monitoring wells MMW-P-08 and MMW-P-07, respectively. Both wells are located at Michigan Plaza. The 2007 data show a large PCE plume between Michigan Plaza and the Michigan Meadows Apartments property to the north. This plume is consistent with releases from the sewer lines. Additionally, PCE results at and directly south of Genuine Parts were non-detect.

Figure 15 shows the PCE isoconcentration contour map for shallow wells for the third and fourth quarter of 2011 (specifically, September through November) at the Allison Transmission property (Favero, 2012; ARCADIS, 2012). Data sets from both quarters were used to provide sufficient data for comparison. Figure 15 shows PCE plumes at AOI-51 and AOI-42. The highest PCE concentrations detected were 32,800 $\mu\text{g/L}$ in AOI-51 and 646 $\mu\text{g/L}$ in AOI-42. The AOI-51 maximum concentration is similar to the June 2005 data. Analytical results for samples from wells surrounding each plume were non-detect, indicating that the extent of PCE

contamination at the Allison Transmission property is delineated. PCE was not detected in monitoring wells between Allison Transmission and the Residential Area.

Figure 16 shows the PCE isoconcentration contour map for shallow wells for December 2011 in the eastern portion of the Study Area (WESTON collected data). There are two PCE contaminant plumes, one in the southeast portion of the Michigan Meadows Apartments property and one at Michigan Plaza. PCE was detected at 400 µg/L in one monitoring well (MMW-1S) at the Michigan Meadows Apartments property. The extent of PCE contamination has not been fully characterized at Michigan Plaza because there are few monitoring wells south or southwest of the plume. The monitoring wells that do exist to the south and southwest are too far from Michigan Plaza to allow accurate definition of the plume. The extent of the PCE plume at the Michigan Meadows Apartments property has not been fully characterized to the east.

Figures 14 and 16 indicate that PCE concentrations have been reduced through CAP 18 ME remediation on the Michigan Plaza property, as planned.

Figure 17 shows the PCE isoconcentration contour map for the deep wells for the third and fourth quarters of 2011 (specifically, September through November) (Favero, 2012; ARCADIS, 2012; ENVIRON, 2012). Data sets from both quarters were used to provide sufficient data for comparison. PCE was detected in AOI-51 at Allison Transmission at a maximum concentration of 29,200 µg/L in MW-0414-S3. However, results south of AOI-51 were non-detect, indicating that the PCE is confined to the Allison Transmission property.

5.2.2.2 TCE Analytical Results

Figures 18 through 22 present TCE concentrations and isoconcentration contours for the second quarter of 2005 at Allison Transmission; the first quarter of 2007 east of Holt Road; the third and fourth quarters of 2011 at Allison Transmission; and the fourth quarter of 2011 for the eastern portion of the Study Area for both shallow and deep wells. Isoconcentration contours were not drawn for **Figures 18 and 22**. TCE was detected at the three PRP properties and the Michigan Meadows Apartments property in 2011. TCE was not detected in the Residential Area or in monitoring wells screened deeper in the A2 aquifer.

Figure 18 shows the TCE results for the second quarter of 2005 for AOI-51 at Allison Transmission (Favero, 2012; ARCADIS, 2012). Not enough wells were sampled in 2007 to allow comparison to the 2007 data sets from Genuine Parts and Michigan Plaza. The highest TCE concentration noted at this time was 2,100 µg/L detected in MW-0414-S3. Monitoring wells downgradient of wells with TCE detections had non-detect results for TCE, indicating that the extent of TCE contamination at the Allison Transmission property is delineated. TCE was not detected in monitoring wells between Allison Transmission and the Residential Area.

Figure 19 shows the TCE isoconcentration map for the first quarter of 2007 for wells east of Holt Road (Mundell, 2007; Keramida, 2010; ENVIRON, 2012). TCE was detected at Genuine Parts, with the highest concentrations to the east in MW-173 at 300 µg/L. TCE concentrations were non-detect in wells located at the center of the Michigan Meadows Apartment property, between Genuine Parts and Michigan Plaza. At Michigan Plaza, TCE concentrations were as high as 356 µg/L in MMW-P-01. The Michigan Plaza plume appears relatively small. However, very limited data are available for the time period because there are few wells with data sufficient to delineate the plume extent.

Figure 20 shows data from the third and fourth quarters of 2011 at Allison Transmission (Favero, 2012; ARCADIS, 2012). The figure shows two TCE contaminant plumes at Allison Transmission. The highest TCE concentration was 4,280 µg/L in MW-0708-S2A in AOI-42 and was 3,120 µg/L in MW-0403-S2B in AOI-51. These data represent a significant increase in TCE concentrations in AOI-51 since 2005 as shown in **Figure 18**. However, results surrounding the plumes were non-detect, indicating that TCE extent is defined at Allison Transmission.

Figure 21 shows the TCE concentrations for the shallow monitoring wells in the eastern portion of the Study Area during the fourth quarter of 2011 (WESTON collected data). TCE was detected at a concentration of 110 µg/L in MW-148R at Genuine Parts. TCE results for several monitoring wells south of MW-148R were non-detect, indicating that TCE is not migrating from Genuine Parts. There are two additional areas with TCE detections: one in the southeast portion of the Michigan Meadows Apartment property and one at Michigan Plaza. At the Michigan Meadows Apartments property, the highest TCE concentration was 21.3 µg/L in monitoring well

MMW-10S. In monitoring well MMW-P-01 on the Michigan Plaza property, TCE was detected at 10.2 µg/L, representing a significant decrease in TCE concentrations from 2007 as shown in **Figure 19**. At Michigan Plaza, TCE concentrations have been reduced through CAP 18 ME remediation, as planned.

Figure 22 shows TCE results for deep monitoring wells in the eastern portion of the Study Area for the fourth quarter of 2011 (WESTON collected data). The figure shows no detections of TCE. TCE does not appear to be migrating in deep groundwater from Genuine Parts or from Michigan Plaza.

5.2.2.3 DCE Analytical Results

Historical cis-1,2-DCE analytical results from 2005 and 2007 are provided in **Figures 23, 24, and 25**. There are significant historical data gaps as detailed in **Section 2**. **Figures 26 and 27** show cis-1,2-DCE concentrations for 2011 analytical data in the eastern portion of the Study Area.

Data from Allison Transmission from the second quarter of 2005 are shown in **Figure 23** (Favero, 2012; ARCADIS, 2012). There were limited or no data from Genuine Parts or Michigan Plaza during this time for comparison. In June 2005, cis-1,2-DCE was detected in three monitoring wells in AOI-51 at Allison Transmission at a maximum concentration of 150 µg/L in monitoring well MW-0416-S2A.

Figure 24 shows cis-1,2-DCE analytical data for samples collected east of Holt Road from the first quarter of 2007 before CAP 18 injections (Mundell, 2007; ENVIRON, 2012). The highest cis-1,2-DCE concentration of 289 µg/L was detected in MMW-8S.

Figure 25 shows cis-1,2-DCE analytical data in deep monitoring wells for samples collected east of Holt Road from the first quarter of 2007 before CAP 18 injections (ENVIRON, 2012). The highest cis-1,2-DCE concentration of 2,400 µg/L was detected in MW-166D. **Figure 25** shows that the cis-1,2-DCE plume is migrating onto the Michigan Meadows Apartments property and Michigan Plaza and is not defined to the west or southwest.

Figure 26 presents the cis-1,2-DCE results for shallow wells for the fourth quarter of 2011 in the eastern portion of the Study Area (WESTON collected data). Cis-1,2-DCE concentrations were as high as 7,710 µg/L in MMW-P-06 at Michigan Plaza, which is a significant increase from concentrations noted during 2007 as shown on **Figure 24**. Cis-1,2-DCE contamination from Michigan Plaza and the Michigan Meadows Apartments property is migrating to the west and south. Increases in cis-1,2-DCE concentrations since CAP 18 ME injections in 2007 and 2009 indicate that CAP 18 ME injections have created an abundance of cis-1,2-DCE in groundwater.

Figure 27 presents the cis-1,2-DCE isoconcentration contours in the eastern portion of the Study Area in deep monitoring wells for the fourth quarter of 2011 (WESTON collected data). Two areas have elevated concentrations. The figure shows that the cis-1,2-DCE plume from the Genuine Parts property has migrated south onto the Michigan Meadows Apartments property. This DCE plume is comingled with the DCE plume located on the Michigan Plaza property further south.

5.2.2.4 VC Analytical Results

Figures 28, 29, 30, and 31 show VC concentrations and isoconcentration contours from 2002, 2005 and 2007. **Figures 32 and 33** present VC concentrations and isoconcentration for the Study Area for the fourth quarter of 2011.

Figure 28 shows results from July 2002 for deep wells east of Holt Road (Keramida, 2010; ENVIRON, 2012). VC was also detected in shallow monitoring wells. However, there were fewer detections and the concentrations typically were lower than in the deep wells. A figure was not generated for VC in shallow monitoring wells from July 2002. **Figure 28** shows a large VC plume extending from Genuine Parts toward the south. VC concentrations were as high as 973 µg/L in MW-165D and then decreased in concentration to the south at 66 µg/L in MW-170D and 6.4 µg/L in MW-169D. It is important to note that no data were available from Michigan Plaza during this time period.

Data from Allison Transmission from the second quarter of 2005 is shown in **Figure 29**. There are limited or no data from 2002 or 2007 to compare to the data from Genuine Parts or Michigan

Plaza. In the second quarter of 2005, VC was detected as high as 250 µg/L in MW-0108-S2B in AOI-51 (Favero, 2012; ARCADIS, 2012). The extent of the VC plume is defined to the south.

Figure 30 presents VC analytical results for shallow monitoring wells east of Holt Road from the first quarter of 2007 (Keramida, 2010; Mundell, 2007; ENVIRON, 2012). The figure shows four plumes: two associated with Genuine Parts and two associated with Michigan Plaza. Concentrations were as high as 230 µg/L in MW-163 east of Genuine Parts. However, VC concentrations at Genuine Parts and to the south show a significant decrease compared to VC concentrations in 2002. At Michigan Plaza, VC concentrations were similar to those at Genuine Parts, with the highest concentration of 40.6 µg/L in MMW-8S near the Michigan Meadows Apartments property. The highest concentration on the Michigan Plaza property was 28.7 µg/L detected in MMW-P-01. Very limited data were available for this time period because few wells existed at the time and because not all wells were sampled.

Figure 31 presents VC analytical results for deep monitoring wells east of Holt Road from the first quarter of 2007 (Mundell, 2007; Keramida, 2010; ENVIRON, 2012). The figure shows two plumes: one associated with Genuine Parts and one associated with Michigan Plaza. VC concentrations were as high as 840 µg/L in MW-165D near Genuine Parts, which represents a slight decrease from 2002 and a smaller plume originating from Genuine Parts. Near Michigan Plaza, the plume contained VC at concentrations similar to VC concentrations observed at Genuine Parts, with the highest concentration of 105 µg/L detected in MW-170D. As stated above, very limited data were available for this time period because few wells existed at the time and because not all wells were sampled.

Figure 32 presents VC concentrations for the fourth quarter of 2011 (WESTON collected data) for shallow wells in the eastern portion of the Study Area. The figure shows that the VC plume at Michigan Plaza was much greater in concentration and extent than during previous sampling events. The highest concentration of 10,500 µg/L was detected in MMW-P-06 at Michigan Plaza. This result represents a significant increase from historical concentrations depicted in **Figure 30** and likely was caused by CAP 18 ME injections.

Figure 33 shows VC concentrations for the fourth quarter 2011 (WESTON collected data) for deep wells in the eastern portion of the Study Area. As with the shallow wells, the VC plume at Michigan Plaza was much greater in concentration and extent than the plume based on historical results as shown in **Figure 31**. The highest concentration of 1,780 µg/L was detected in MMW-P-10D at Michigan Plaza. The plume extends west from Michigan Plaza into the Residential Area.

VC results were non-detect for monitoring wells sampled between Allison Transmission and the Residential Area. VC was not detected at elevated concentrations in Allison Transmission wells. Therefore, figures were not prepared for Allison Transmission. VC also was detected in 2011 in two of the four residential wells sampled at 4012 Cossell Road and 4018 West Vermont Street.

6. FINDINGS AND CONCLUSIONS

The Study Area for the analytical and hydrogeological evaluation contains several potential sources of VC contamination in the residential wells, including Allison Transmission, Genuine Parts, and Michigan Plaza. Each PRP property had releases of PCE or TCE, with DCE and VC as natural breakdown products. The U.S. EPA identified data gaps between the PRP properties and Residential Area and attempted to fill those data gaps during this investigation.

VC was detected in two samples collected from drinking water wells in the Residential Area in December 2011 - at 4012 Cossell Road (26.1 µg/L) and at 4018 West Vermont Street (4.8 µg/L). Historically, VC has been detected consistently at three residential properties. These properties are on the eastern boundary of the Residential Area. Residential Area wells were not sampled before 2009. Therefore, data are not available to determine when VC contamination first impacted the Residential Area drinking water wells.

GM installed monitoring wells downgradient of AOI-51 along West Michigan Street to monitor contaminant migration from Allison Transmission. These monitoring wells have showed non-detect results for PCE, TCE, DCE, and VC since their installation. However, the U.S. EPA determined that at least two monitoring wells on West Michigan Street directly north of the Residential Area are screened in zones deeper than contamination at Allison Transmission and deeper than the residential wells. During the investigation, the U.S. EPA installed two nested monitoring well sets along West Michigan Street to fill this data gap. The data collected confirm that PCE, TCE, DCE, and VC are not present between Allison Transmission and the Residential Area. Although chlorinated solvents are present at Allison Transmission, the data indicate that the contamination is restricted to the Allison Transmission property, and Allison Transmission is not a contributor to Residential Area well contamination.

There is a significant temporal gap between 2002 and 2007 in groundwater data from Genuine Parts near the Residential Area. Historically, DCE and VC migrated from Genuine Parts to the south-southwest. A VC plume extended from Genuine Parts south to monitoring well MW-170D near the Residential Area, and as far south as MW-169D on Cossell Road as indicated by

Keramida (Keramida, 2007). During the investigation, no contamination was detected in monitoring wells or VAS borings between Genuine Parts and the Residential Area indicating that remedial efforts at the Genuine Parts facility have reduced contamination and limited plume migration. However, Genuine Parts cannot be excluded as a contributor to the Residential Area contamination based on historical detections of VC contamination from Genuine Parts to the south-southwest near the Residential Area.

VC concentrations have increased significantly in groundwater because of CAP 18 ME injections at Michigan Plaza and the Michigan Meadows Apartments property. Evidence supporting this conclusion can be drawn from VC concentration increases noted in monitoring wells after CAP 18 ME injections. VC concentrations increased in monitoring well MMW-P-06 from 21 µg/L in November 2005 to 15,600 µg/L in July 2011. Samples from MW-170D showed increases in VC concentration approximately 10 to 17 months after each injection. CAP 18 ME remediation at Michigan Plaza began before the full horizontal and vertical extent of contamination was delineated. There were few monitoring wells at Michigan Plaza in 2007, and only two or three rounds of analytical data were collected before the CAP 18 ME injections were initiated. Additionally, many monitoring wells at Michigan Plaza are blind drilled below the water table. Both of these conditions created data gaps preventing full delineation of the initial extent of contamination before the CAP 18 ME injections. During U.S. EPA's field investigation, cis-1,2-DCE and VC were detected in monitoring wells and VAS borings between Michigan Plaza and the Residential Area.

The U.S. EPA has determined that both Genuine Parts and Michigan Plaza are actual or potential contributors to VC contamination in the Residential Area. Allison Transmission is not a contributor to contamination in the Residential Area.

Notes:

µg/L = Micrograms per Liter

ND = Not detected

TCE = Trichloroethene

VC = Vinyl chloride

DCE = Dichloroethene

MCL = Maximum contaminant level

U.S. EPA = United States Environmental Protection Agency

ID = Identification

PCE = Tetrachloroethene

VAS = Vertical aquifer sampling

Bolded and shaded results exceed enforceable U.S. EPA MCL drinking water standards.

GROUNDWATER ELEVATION SUMMARY - DECEMBER 2011
WEST VERMONT STREET
SPEEDWAY, MARION COUNTY, INDIANA**

Well ID	Top of Casing Elevation (ft amsl)	Depth to Water (ft btoc)	Groundwater Elevation (ft amsl)	Screened Interval (ft)	Total Depth (ft)
Residential Area Wells					
RES-4042 WVS	NA	23.43	NA	NA	33

Notes:

* = Groundwater elevation not calculated because of presence of nonaqueous-phase liquid

amsl = Above mean sea level

btoc = Below top of casing

ft = Foot

ID = Identification

NA = Information not readily available

¹ Nonaqueous-phase liquid present; depth listed is from top of casing to nonaqueous-phase liquid

² Well gauged; geographic coordinate and top of casing elevation unavailable

RES-4042 WVS	A2 Shallow	ND	ND	ND	ND	ND	ND

Notes:

µg/L = Micrograms per Liter

DCE = Dichloroethene

Well ID = Well Identification

MCL = Maximum Contaminant Level

62.9D/dup = Duplicate result

ND = Not detected above the screening value

PCE = Tetrachloroethene

TCE = Trichloroethene

U.S. EPA = United States Environmental Protection Agency

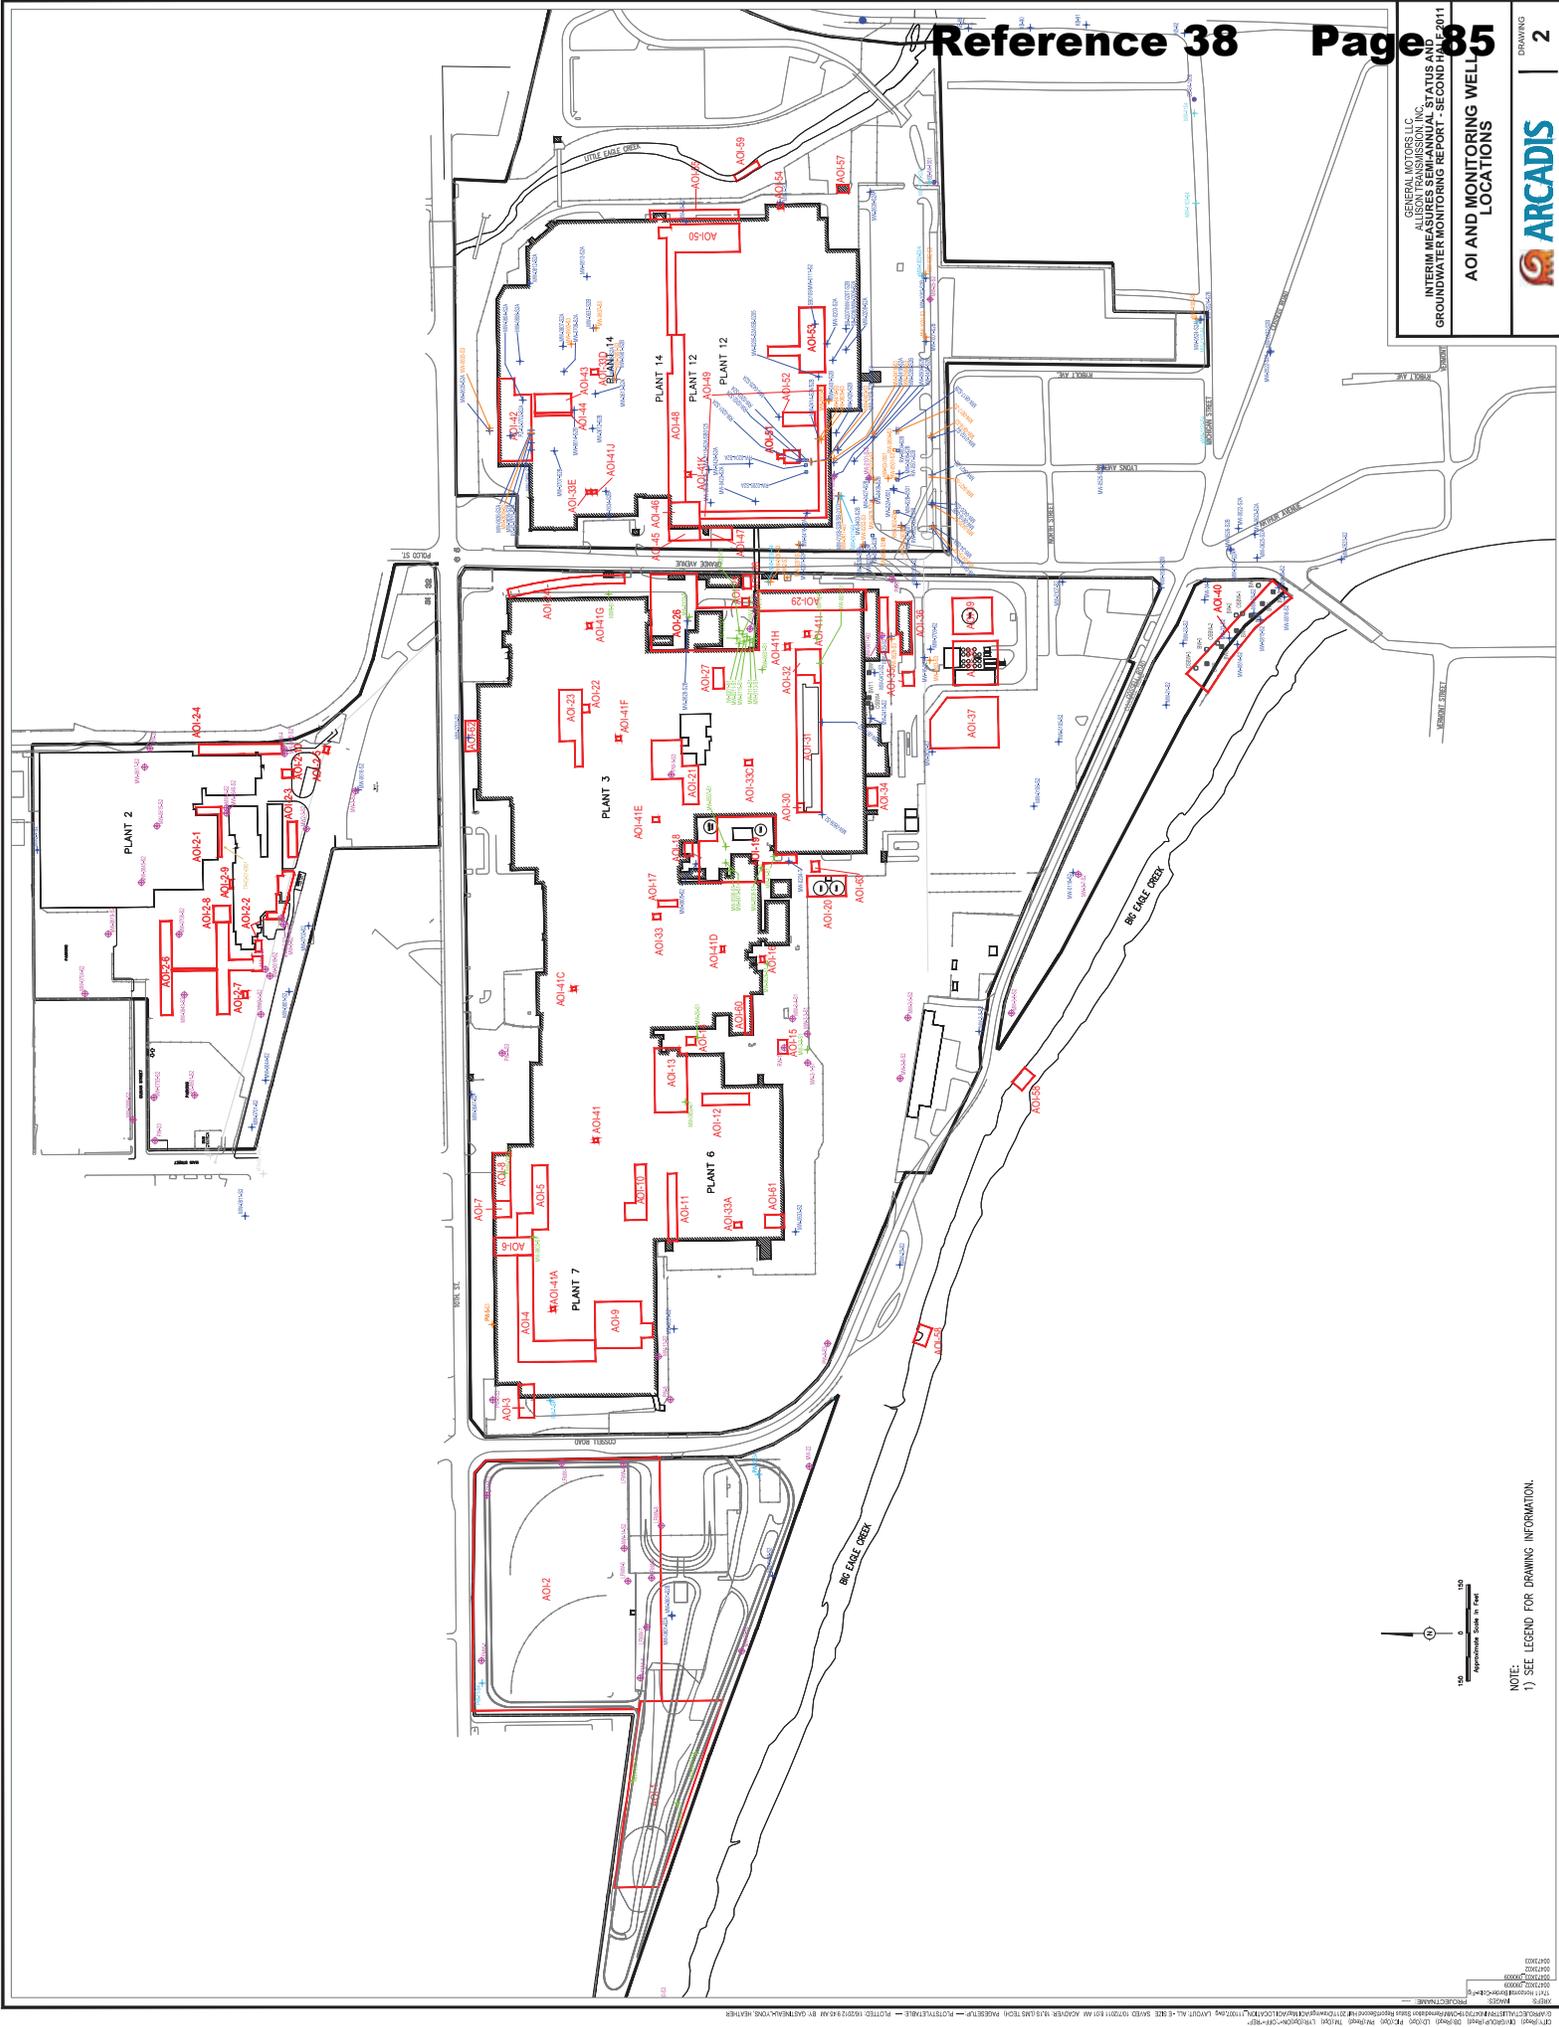

VC = Vinyl chloride

VOC = Volatile organic compound

Bolded and shaded results exceed U.S. EPA MCL drinking water standards.¹ Action level based on enforceable U.S. EPA MCL² These results were collected by GM's consultant ARCADIS. GM is the responsible party for this Site.

APPENDIX B

**DATA VALIDATION AND ANALYTICAL REPORTS FOR THE U.S. EPA
(WESTON SOLUTIONS, INC.) 2011 INVESTIGATION**

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: November 18, 2011

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5054618, 5054648, 5054676

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for five water samples collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-110911-VAS01(25-30)	5054618001	Water	11/9/2011	11/9/2011
WVS-110911-VAS01-(32.5-37.5)	5054648001	Water	11/9/2011	11/10/2011
WVS-111011-VAS01-(41-46)	5054648002	Water	11/10/2011	11/10/2011
WVS-111011-VAS01-(41-46) DUP	5054648003	Water	11/10/2011	11/10/2011
WVS-111011-VAS01-(50-55')	5054676001	Water	11/10/2011	11/11/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5054618, 5054648, 5054676

3. **Blanks**

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

4. **Surrogate Results**

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. **Laboratory Control Sample (LCS) Results**

The LCS recoveries were within laboratory QC limits.

6. **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results**

An MS and MSD were not analyzed with the samples. No qualifications are required.

7. **Field Duplicate Results**

Sample WVS-111011-VAS01-(41-46) DUP is a field duplicate of sample WVS-111011-VAS01-(41-46). Vinyl chloride was the only compound detected in both samples. The relative percent difference (RPD) was calculated to be 11.6 percent which is acceptable. There is good correlation between the field sample and field duplicate.

8. **Overall Assessment**

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5054676

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: November 29, 2011

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5054712 and 5054747

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 13 soil samples collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

Data Validation Report
 West Vermont Hydrogeological Investigation
 Pace Analytical Services, Inc.
 Laboratory Project #: 5054712 and 5054747

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-SB01-(6.5-9)-111011-SS	5054712001	Soil	11/10/2011	11/16/2011
WVS-SB01-(16-19)-111011-SS	5054712002	Soil	11/10/2011	11/16/2011
WVS-SB02-(13-15)-111011-SS	5054712003	Soil	11/10/2011	11/16/2011
WVS-SB02-(13-14)-111011-SS	5054712004	Soil	11/10/2011	11/16/2011
WVS-SB03-(12-13)-111011-SS	5054712005	Soil	11/10/2011	11/16/2011
WVS-SB03-(19-20)-111011-SS	5054712006	Soil	11/10/2011	11/16/2011
WVS-SB04-(14-15)-111011-SS	5054712007	Soil	11/10/2011	11/16/2011
WVS-SB04-(14-15)-111011-SS-DUP	5054712008	Soil	11/10/2011	11/16/2011
WVS-SB05-(14-15)-111111-SS	5054747001	Soil	11/11/2011	11/16/2011
WVS-SB05-(17-18)-111111-SS	5054747002	Soil	11/11/2011	11/16/2011
WVS-SB06-(13-14)-111111-SS	5054747003	Soil	11/11/2011	11/16/2011
WVS-SB06-(19-20)-111111-SS	5054747004	Soil	11/11/2011	11/16/2011
WVS-SB06-(19-20)-111111-SS-DUP	5054747005	Soil	11/11/2011	11/17/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits except for as follows.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5054712 and 5054747

In the LCS associated with work order 5054712, dichlorodifluoromethane was detected low (56 percent recovery). The quantitation limits for dichlorodifluoromethane in work order 5054712 were flagged 'UJ' as estimated due to this discrepancy.

In an LCS associated with work order 5054747, the following VOCs were detected high: 1,2-dibromo-3-chloropropane and bromoform. Because these two compounds were not detected in the samples, no qualifications were required.

In an LCS associated with work order 5054747, methylene chloride was detected slightly below the QC limit with a recovery of 68 percent. No qualifications were applied for this minor discrepancy.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

A site-specific MS and MSD were not analyzed with the samples. No qualifications are required.

7. Field Duplicate Results

Sample WVS-SB04-(14-15)-111011-SS-DUP is a field duplicate of sample WVS-SB04-(14-15)-111011-SS and sample WVS-SB06-(19-20)-111111-SS-DUP is a field duplicate of sample WVS-SB06-(19-20)-111111-SS.

For field duplicate WVS-SB06-(19-20)-111111-SS-DUP, both samples (field duplicate and parent sample) were non-detect for VOCs indicating good correlation between the two samples.

For field duplicate WVS-SB04-(14-15)-111011-SS-DUP, the parent sample contained 207 micrograms per kilogram ($\mu\text{g}/\text{kg}$) acetone and 9.1 $\mu\text{g}/\text{kg}$ methyl acetate. The field duplicate was non-detect for these two compounds. This indicates some minor sample heterogeneity associated with these compounds in this sample. No qualifications are required.

8. Overall Assessment

The VOC data are acceptable for use as qualified based on the information received.

QUALIFIERS

Project: West Vermont Street Task 1624

Pace Project No.: 5054747

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

- L0 Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
- L3 Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
- N2 The lab does not hold TNI accreditation for this parameter.
- R2 RPD value was outside control limits due to matrix interference

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: November 18, 2011

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5054710, 5054742, and 5054744

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for five water samples plus one trip blank collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-VAS02-111111-(25'-30')	5054710001	Water	11/11/2011	11/11/2011
WVS-VAS02-111111-(35'-40')	5054710002	Water	11/11/2011	11/11/2011
WVS-VAS02-111111-(45'-50')	5054742001	Water	11/11/2011	11/11/2011
TRIP BLANK	5054742002	Water	11/11/2011	11/11/2011
WVS-SB-05-111111-GW	5054744001	Water	11/11/2011	11/11/2011
WVS-SB-05-111111-GW-DUP	5054744002	Water	11/11/2011	11/14/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5054710, 5054742, and 5054744

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

In addition, the trip blank contained no detections of VOCs above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

An MS and MSD was analyzed using a sample from the West Vermont Site. The recoveries and relative percent differences (RPD) were acceptable.

7. Field Duplicate Results

Sample WVS-SB-05-111111-GW-DUP is a field duplicate of sample WVS-SB-05-111111-GW. Cis-1,2-dichloroethene was detected at 5.8 micrograms per liter ($\mu\text{g/L}$) in the field sample but was not detected in the duplicate sample. Because the detection was near the reporting limit of 5 $\mu\text{g/L}$, data usability is not affected. Tetrachloroethene was detected in both samples and the RPD between the results is 25 percent which is acceptable.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street Task 1624

Pace Project No.: 5054744

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

R1 RPD value was outside control limits.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: November 18, 2011

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5054786

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for two water samples plus one trip blank collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-VAS03-111411-(30-35')	5054786001	Water	11/14/2011	11/15/2011
WVS-VAS03-111411-(40-45')	5054786002	Water	11/14/2011	11/15/2011
Trip Blank	5054786003	Water	11/14/2011	11/15/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5054786

3. Blanks

A method blank was analyzed with the VOC analyses and was free of target compound contamination above the reporting limit.

In addition, the trip blank contained no detections of VOCs above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

An MS and MSD were not analyzed with this work order. No qualifications are required.

7. Field Duplicate Results

There are no field duplicates associated with this work order.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5054786

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: November 29, 2011

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5054852, 5054874, and 5054902

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for nine water samples plus one trip blank collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-VAS04-111611-FB	5054852001	Water	11/16/2011	11/16/2011
WVS-VAS04-111611-DW	5054852002	Water	11/16/2011	11/16/2011
WVS-VAS04-111511-(25-30')	5054852003	Water	11/16/2011	11/16/2011
WVS-VAS04-111611-(39-44')	5054852004	Water	11/16/2011	11/16/2011
TRIP BLANK	5054852005	Water	11/16/2011	11/16/2011
WVS-VAS04-111611-(39-44') DUP	5054852006	Water	11/16/2011	11/16/2011
WVS-VAS05-111611-(20-25')	5054874001	Water	11/16/2011	11/16/2011
WVS-VAS05-111611-(32.5-37.5')	5054874002	Water	11/16/2011	11/16/2011
WVS-VAS05-111611-(45-50')	5054874003	Water	11/16/2011	11/16/2011
WVS-VAS05-111711-(63-68')	5054902001	Water	11/17/2011	11/17/2011

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5054852, 5054874, and 5054902

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

The trip blank did not contain target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits except for as follows. Methylcyclohexane was detected high, above the QC limit in the LCS. Because this compound was not detected in the samples no qualification is required.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

A site-specific MS and MSD were not analyzed with the samples. No qualifications are required.

7. Field Duplicate Results

Sample WVS-VAS04-111611-(39-44') DUP is a field duplicate of sample WVS-VAS04-111611-(39-44'). Both samples (field duplicate and parent sample) were non-detect for VOCs indicating good correlation between the two samples.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street Task 1624

Pace Project No.: 5054902

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: January 12, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5055574, 5055591, and 5055593

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for fourteen water samples plus three trip blanks collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review” dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-MW175S-120711-GW	5055574001	Water	12/7/2011	12/17/2011
WVS-MW175D-120711-GW	5055574002	Water	12/7/2011	12/17/2011
WVS-MW169D-120711-GW	5055574004	Water	12/7/2011	12/17/2011
TRIP BLANK 2	5055574006	Water	12/7/2011	12/17/2011
MVS-174S-120711-GW	5055591001	Water	12/7/2011	12/17/2011
MVS-174D-120711-GW	5055591002	Water	12/7/2011	12/17/2011
MVS-MW145-120711-GW	5055591003	Water	12/7/2011	12/17/2011
MVS-MW148R-120711-GW	5055591004	Water	12/7/2011	12/17/2011
MVS-MW161-120711-GW	5055591005	Water	12/7/2011	12/17/2011
MVS-MW161-120711-GW-DP	5055591006	Water	12/7/2011	12/17/2011
TRIP BLANK 1	5055591007	Water	12/7/2011	12/17/2011
MVS-MMW166S-120711-GW	5055593001	Water	12/7/2011	12/17/2011
MVS-MMW166D-120711-GW	5055593002	Water	12/7/2011	12/17/2011

Data Validation Report
 West Vermont Hydrogeological Investigation
 Pace Analytical Services, Inc.
 Laboratory Project #: 5055574, 5055591, and 5055593

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
MVS-MW165S-120711-GW	5055593003	Water	12/7/2011	12/17/2011
MVS-MW165D-120711-GW	5055593004	Water	12/7/2011	12/19/2011
MVS-MW165D-120711-GW-DP	5055593005	Water	12/7/2011	12/19/2011
TRIP BLANK 3	5055593006	Water	12/7/2011	12/19/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

The trip blanks did not contain target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) Results

Site-specific MS samples were analyzed with the samples. The percent recoveries were within QC limits.

7. Field Duplicate Results

Sample MVS-MW161-120711-GW-DP is a field duplicate of sample MVS-MW161-120711-GW and sample MVS-MW165D-120711-GW-DP is a field duplicate of sample MVS-MW165D-120711-GW. Most results were non-detect. The RPDs were calculated for detected results and these ranged from 8 to 9 percent which is acceptable. There is good correlation between the parent and duplicate samples.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5055574, 5055591, and 5055593

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

ANALYTICAL RESULTS

Project: West Vermont Street

Pace Project No.: 5055574

Sample: WVS-MW175D-120711-GW **Lab ID: 5055574002** Collected: 12/07/11 11:08 Received: 12/07/11 16:06 Matrix: Water

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual
8260 MSV		Analytical Method: EPA 8260						
Trichlorofluoromethane	ND	ug/L	5.0	1		12/17/11 10:34	75-69-4	
1,1,2-Trichlorotrifluoroethane	ND	ug/L	5.0	1		12/17/11 10:34	76-13-1	
Vinyl chloride	ND	ug/L	2.0	1		12/17/11 10:34	75-01-4	
m&p-Xylene	ND	ug/L	5.0	1		12/17/11 10:34	179601-23-1	
o-Xylene	ND	ug/L	5.0	1		12/17/11 10:34	95-47-6	
Surrogates								
Dibromofluoromethane (S)	116 %.		83-123	1		12/17/11 10:34	1868-53-7	
4-Bromofluorobenzene (S)	102 %.		72-125	1		12/17/11 10:34	460-00-4	
Toluene-d8 (S)	100 %.		81-114	1		12/17/11 10:34	2037-26-5

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5055593

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: January 12, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5055666 and 5055667

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for eleven water samples plus two trip blanks collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-MW170D-120711-GW	5055666001	Water	12/7/2011	12/19/2011
WVS-MW170S-120711-GW	5055666002	Water	12/7/2011	12/19/2011
WVS-MW0524S2A-120811-GW	5055666003	Water	12/8/2011	12/19/2011
WVS-MW0524S2B-120811-GW	5055666004	Water	12/8/2011	12/19/2011
WVS-MMWP13S-120811-GW	5055666005	Water	12/8/2011	12/19/2011
WVS-MMWP13D-120811-GW	5055666006	Water	12/8/2011	12/19/2011
TRIP BLANK 1	5055666007	Water	12/8/2011	12/19/2011
WVS-MW0522-52B-120811-GW	5055667001	Water	12/8/2011	12/19/2011
WVS-MW0522-52B-120811-GW-DUP	5055667002	Water	12/8/2011	12/19/2011
WVS-MW0522-52A-120811-GW	5055667003	Water	12/8/2011	12/19/2011
WVS-MMWD-11S-120811-GW	5055667004	Water	12/8/2011	12/19/2011
TRIP BLANK 2	5055667005	Water	12/8/2011	12/19/2011
WVS-MW167D-120711-GW	5055667006	Water	12/8/2011	12/19/2011

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5055666 and 5055667

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

The trip blanks did not contain target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

Site-specific MS and MSD samples were analyzed with the samples. The percent recoveries and relative percent differences (RPD) were within QC limits.

7. Field Duplicate Results

Sample WVS-MW0522-52B-120811-GW-DUP is a field duplicate of sample WVS-MW0522-52B-120811. The parent and field duplicate sample were non-detect for VOCs indicating good correlation between the two samples.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5055667

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

R1 RPD value was outside control limits.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: January 12, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5055747

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for nineteen water samples plus one trip blank collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-MW168D-120711-GW	5055747001	Water	12/7/2011	12/20/2011

TRIP BLANK 1	5055747020	Water	12/9/2011	12/20/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

The trip blank did not contain target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

Site-specific MS and MSD samples were analyzed with the samples. The percent recoveries and relative percent differences (RPD) were within QC limits except for as follows. A couple of compounds had percent recoveries or RPDs outside the QC limits. However, these compounds were not detected in the samples and no qualifications were applied.

7. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5055747

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

1d Multiple compounds RPD's are outside of the required control limits. Refer to the LCS for system control and data acceptability. slb122211

M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

N2 The lab does not hold TNI accreditation for this parameter.

R1 RPD value was outside control limits.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: January 12, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5055802, 5055803, and 5055804

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 21 water samples plus 3 trip blanks collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review” dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed

Trip Blank 1	5055804010	Water	12/12/2011	12/22/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

The trip blanks did not contain target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

Site-specific MS and MSD samples were analyzed with the samples. The percent recoveries and relative percent differences (RPD) were within QC limits.

Data Validation Report
West Vermont Hydrogeological Investigation
Pace Analytical Services, Inc.
Laboratory Project #: 5055802, 5055803, and 5055804

7. Field Duplicate Results

Sample WVS-MWWES-01B-121211-GW-DUP is a field duplicate of sample WVS-MWWES-01B-121211-GW. The parent and field duplicate sample were non-detect for all VOCs except for vinyl chloride. The RPD for vinyl chloride was calculated to be 4 percent. There was good correlation between the field duplicate and parent sample.

Sample WVS-MMWP05-120911-GW-DP is a field duplicate of sample WVS-MMWP05-120911-GW. For the two detected compounds, RPDs were calculated to be 2 and 7 percent which is acceptable. There was good correlation between the field duplicate and parent sample.

Sample WVS-4031cossell-121211-GW-DP is a field duplicate of sample WVS-4031cossell-121211-GW. The parent and field duplicate sample were non-detect for all VOCs which indicates good correlation between the field duplicate and parent sample.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5055804

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

- 1d Benzene ND at an estimated RL of 5 ug/L based on the MDL. grm 12-22-11
- 2d Several compounds are outside of acceptance limits for RPD value. Refer to the LCS for system control. grm 12-22-11
- D4 Sample was diluted due to the presence of high levels of target analytes.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- N2 The lab does not hold TNI accreditation for this parameter.

**WEST VERMONT HYDROGEOLOGIC INVESTIGATION
SPEEDWAY, INDIANA
DATA VALIDATION REPORT**

Date: January 13, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5055916 and 5055918

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1625.00/S05-0001-1109-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 14 water samples and two solid samples collected for the West Vermont Hydrogeological Investigation Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Target Compound List (TCL) Volatile Organic Compounds (VOC) by SW-846 Method 8260
- Toxicity Characteristic Leaching Procedure (TCLP) VOCs by SW-846 Methods 1311 and 8260
- TCLP Semivolatile Organic Compounds (SVOC) by SW-846 Methods 1311 and 8270

A level II data package was requested from Pace. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review” dated June 2008. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCL VOCs BY SW-846 METHOD 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-4012COSSEL-121211-GW	5055916001	Water	12/12/2011	12/22/2011
WVS-4018WVERMONT-121211-GW	5055916002	Water	12/12/2011	12/22/2011
WVS-4042WVERMONT-121211-GW	5055916003	Water	12/12/2011	12/22/2011
WVS-MWWES04A-121211-GW	5055916004	Water	12/12/2011	12/22/2011
WVS-MWWES04B-121211-GW	5055916005	Water	12/12/2011	12/22/2011

Data Validation Report
 West Vermont Hydrogeological Investigation
 Pace Analytical Services, Inc.
 Laboratory Project #: 5055916 and 5055918

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
WVS-MWWES05b-121211-GW	5055916006	Water	12/12/2011	12/22/2011
WVS-MWWES05c-121211-GW	5055916007	Water	12/12/2011	12/22/2011
WVS-MWWES03a-121211-GW	5055916008	Water	12/12/2011	12/22/2011
WVS-MWWES03a-121211-DP	5055916009	Water	12/12/2011	12/22/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses and were free of target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

Site-specific MS and MSD samples were analyzed with the samples. The percent recoveries and relative percent differences (RPD) were within QC limits.

7. Field Duplicate Results

Sample WVS-MWWES03a-121211-DP is a field duplicate of sample WVS-MWWES03a-121211-GW. The parent and field duplicate sample were non-detect for all VOCs which indicates good correlation between the field duplicate and parent sample.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

A method blank was analyzed with the TCLP VOC analyses and was free of target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established QC limits.

5. LCS Results

The LCS recoveries were within laboratory QC limits.

6. MS Results

A site-specific MS sample was analyzed with the samples. The percent recoveries were within QC limits.

7. Overall Assessment

The TCLP VOC data are acceptable for use based on the information received.

Data Validation Report
 West Vermont Hydrogeological Investigation
 Pace Analytical Services, Inc.
 Laboratory Project #: 5055916 and 5055918

TCLP SVOCs BY SW-846 METHODS 1311 AND 8270

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Extracted	Date Analyzed
B-1	5055918001	Water	12/13/2011	12/21/2011	12/21/2011
B-2	5055918002	Water	12/13/2011	12/21/2011	12/21/2011
B-3	5055918003	Water	12/13/2011	12/21/2011	12/21/2011
B-4	5055918004	Water	12/13/2011	12/21/2011	12/21/2011
B-5	5055918005	Water	12/13/2011	12/21/2011	12/21/2011
B-6	5055918006	Solid	12/13/2011	12/21/2011	12/21/2011
B-7	5055918007	Solid	12/13/2011	12/21/2011	12/21/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days to extraction and 40 days from extraction to analysis.

3. Blanks

A method blank was analyzed with the TCLP SVOC analyses and was free of target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established QC limits.

5. LCS Results

The LCS recoveries were within laboratory QC limits.

6. MS Results

A site-specific MS sample was analyzed with the samples. The percent recoveries were within QC limits.

7. Overall Assessment

The TCLP SVOC data are acceptable for use based on the information received.

QUALIFIERS

Project: West Vermont Street

Pace Project No.: 5055918

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

Sample Information

Sample ID: JJ072709-8 Lab ID: F094254301
 Sample Location: 4017 COSSELL RD,
 INDIANAPOLIS, IN 46222
 Reason for Sampling: Survey Sample Description: outside spigot

Collection Information

Collection: MCHD-WQ/IAQ/HMM
 3838 North Rural Street, 5th Floor
 Indianapolis, IN 46205
 Collected By: Jeffery Jacquez Date Received: July 27, 2009 14:16
 Date Collected: July 27, 2009 1:10

Final Results

Sample ID: JJ072709-8 Lab ID: F094254301
 Matrix: Well Water Date Completed: July 30, 2009 23:07
 Received on Ice, 2-8 degrees Celsius Date Reported: August 10, 2009 10:26
